Agenda

- 
- 1 Session Overview**
 - 2 Reliable Data Transfer**
 - 3 Summary and Conclusion**

- Course description and syllabus:

- » <http://www.nyu.edu/classes/jcf/csci-ga.2262-001/>

- » <http://cs.nyu.edu/courses/spring16/CSCI-GA.2262-001/index.html>

- Textbooks:

- » ***Computer Networking: A Top-Down Approach (6th Edition)***

James F. Kurose, Keith W. Ross

Addison Wesley

ISBN-10: 0132856204, ISBN-13: 978-0132856201, 6th Edition (02/24/12)

- Computer Networks and the Internet
- Application Layer
- Fundamental Data Structures: queues, ring buffers, finite state machines
- Data Encoding and Transmission
- Local Area Networks and Data Link Control
- Wireless Communications
- Packet Switching
- OSI and Internet Protocol Architecture
- Congestion Control and Flow Control Methods
- Internet Protocols (IP, ARP, UDP, TCP)
- Network (packet) Routing Algorithms (OSPF, Distance Vector)
- IP Multicast
- Sockets

- Introduction to Basic Networking Concepts (Network Stack)
- Origins of Naming, Addressing, and Routing (TCP, IP, DNS)
- Physical Communication Layer
- MAC Layer (Ethernet, Bridging)
- Routing Protocols (Link State, Distance Vector)
- Internet Routing (BGP, OSPF, Programmable Routers)
- TCP Basics (Reliable/Unreliable)
- Congestion Control
- QoS, Fair Queuing, and Queuing Theory
- Network Services – Multicast and Unicast
- Extensions to Internet Architecture (NATs, IPv6, Proxies)
- Network Hardware and Software (How to Build Networks, Routers)
- Overlay Networks and Services (How to Implement Network Services)
- Network Firewalls, Network Security, and Enterprise Networks

- Principles of Reliable Data Transfer
- Reliable Data Transfer: Getting Started
- Reliable Data Transfer: Operational Details
- Other Reliable Data Transfer Protocols
- Conclusion

Agenda

- 1 Session Overview

- 2 Reliable Data Transfer

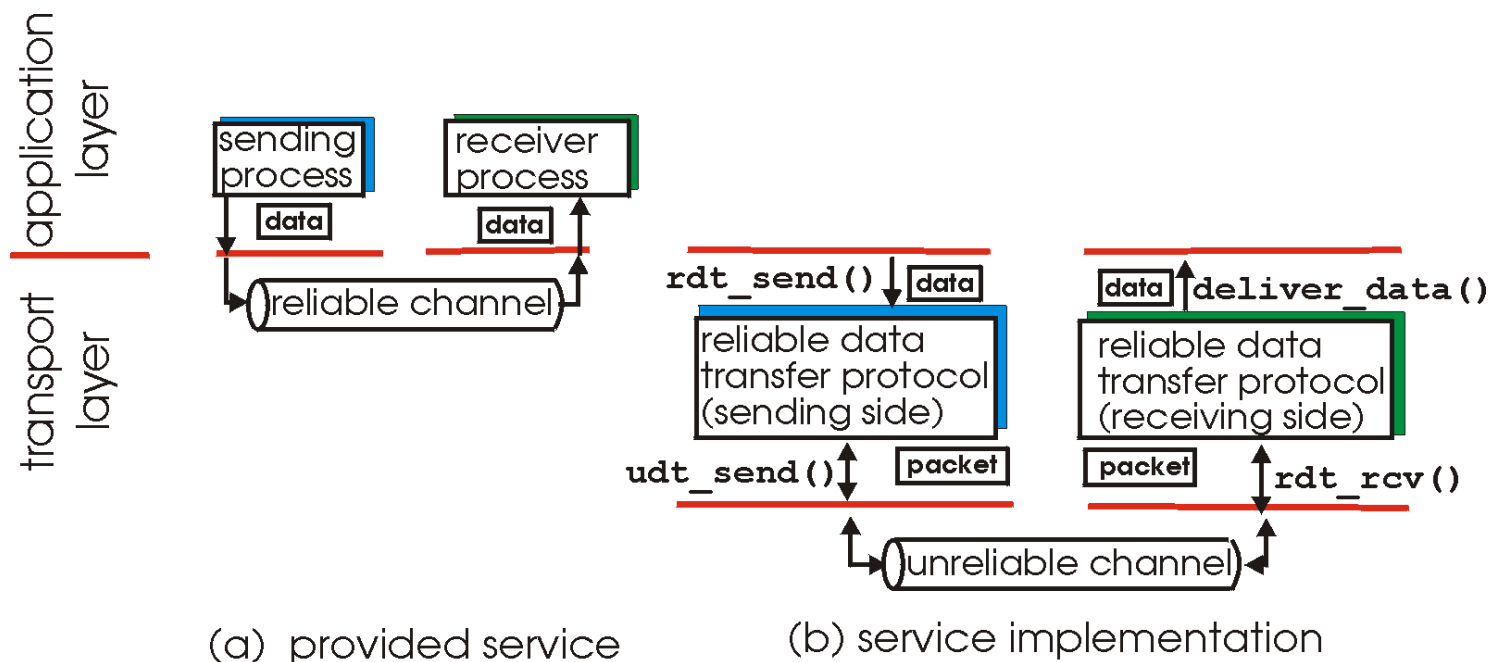

- 3 Summary and Conclusion

- Principles of Reliable Data Transfer
- Reliable Data Transfer: Getting Started
- Reliable Data Transfer: Operational Details
- Other Reliable Data Transfer Protocols

Principles of Reliable Data Transfer

- Important in app., transport, link layers
- Top-10 list of important networking topics!

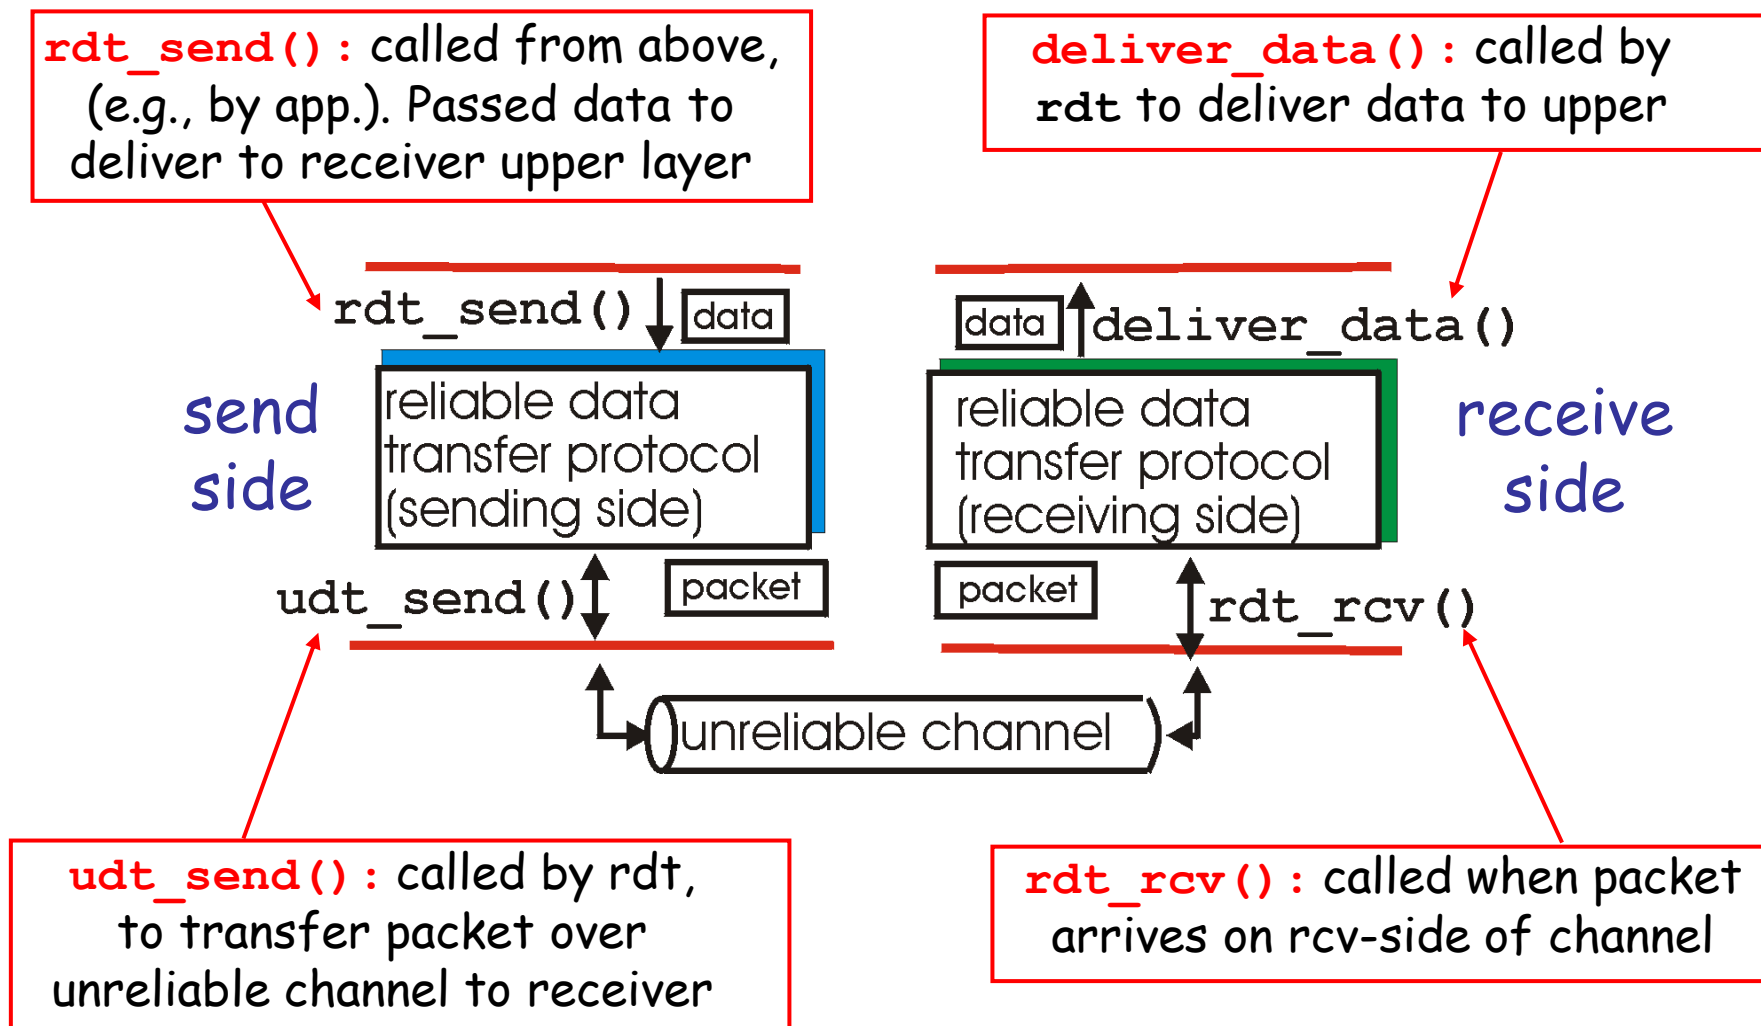

- Characteristics of unreliable channel will determine complexity of reliable data transfer protocol (rdt)

- Principles of Reliable Data Transfer
- **Reliable Data Transfer: Getting Started**
- Reliable Data Transfer: Operational Details
- Other Reliable Data Transfer Protocols

Reliable Data Transfer: Getting Started

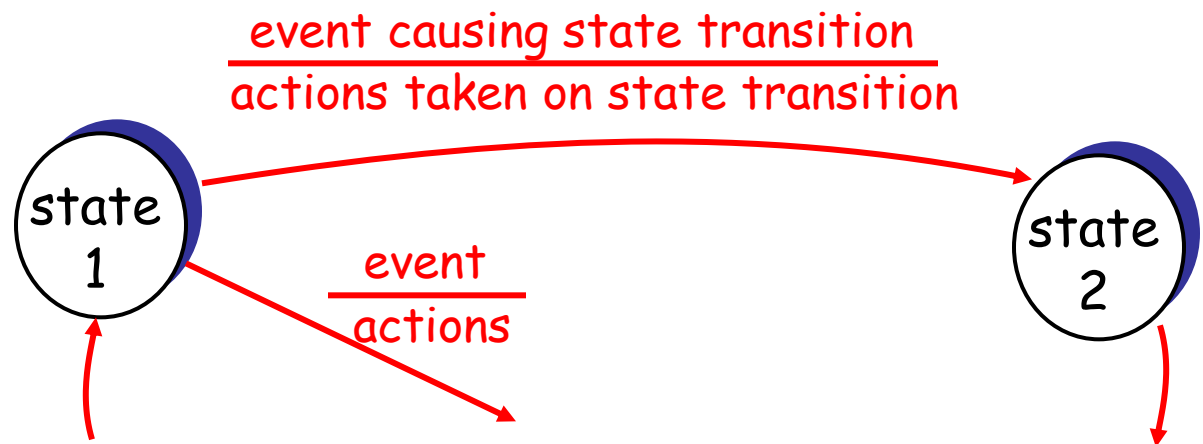

Reliable Data Transfer: Getting Started

We'll:

- Incrementally develop sender, receiver sides of reliable data transfer protocol (rdt)
- Consider only unidirectional data transfer
 - But control info will flow on both directions!
- Use finite state machines (FSM) to specify sender, receiver

state: when in this “state” next state uniquely determined by next event

- Principles of Reliable Data Transfer
- Reliable Data Transfer: Getting Started
- **Reliable Data Transfer: Operational Details**
- Other Reliable Data Transfer Protocols

Rdt1.0 - Reliable Transfer Over a Reliable Channel

- Underlying channel perfectly reliable
 - No bit errors
 - No loss of packets
- Separate FSMs for sender, receiver:
 - Sender sends data into underlying channel
 - Receiver read data from underlying channel

sender

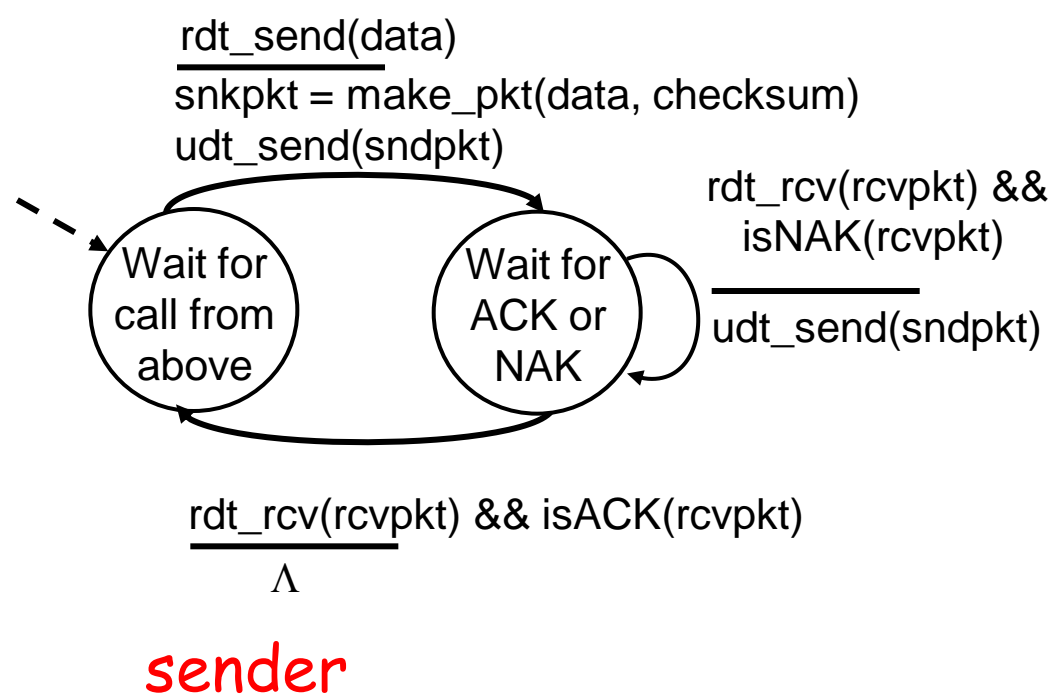

receiver

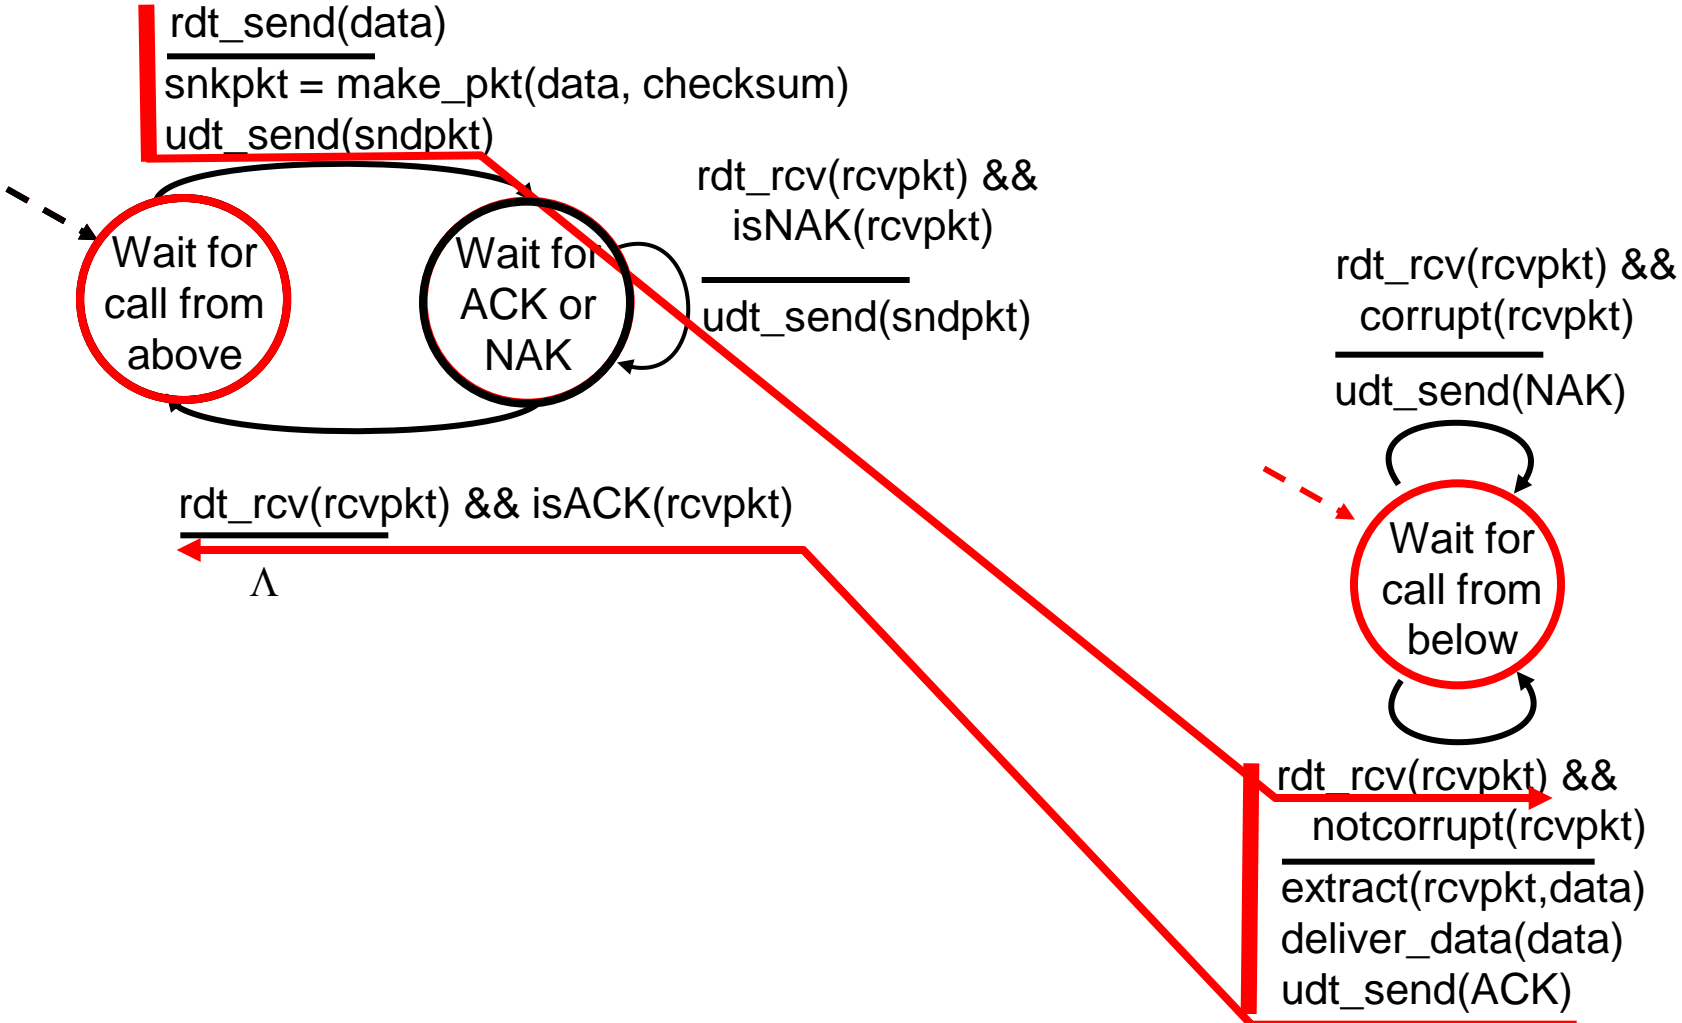

Rdt2.0: Channel with Bit Errors

- Underlying channel may flip bits in packet
 - Checksum to detect bit errors
- *The question: how to recover from errors:*
 - *Acknowledgements (ACKs):* receiver explicitly tells sender that pkt received OK
 - *Negative acknowledgements (NAKs):* receiver explicitly tells sender that pkt had errors
 - Sender retransmits pkt on receipt of NAK
- New mechanisms in **rdt2.0** (beyond **rdt1.0**):
 - Error detection
 - Receiver feedback: control msgs (ACK,NAK) rcvr->sender

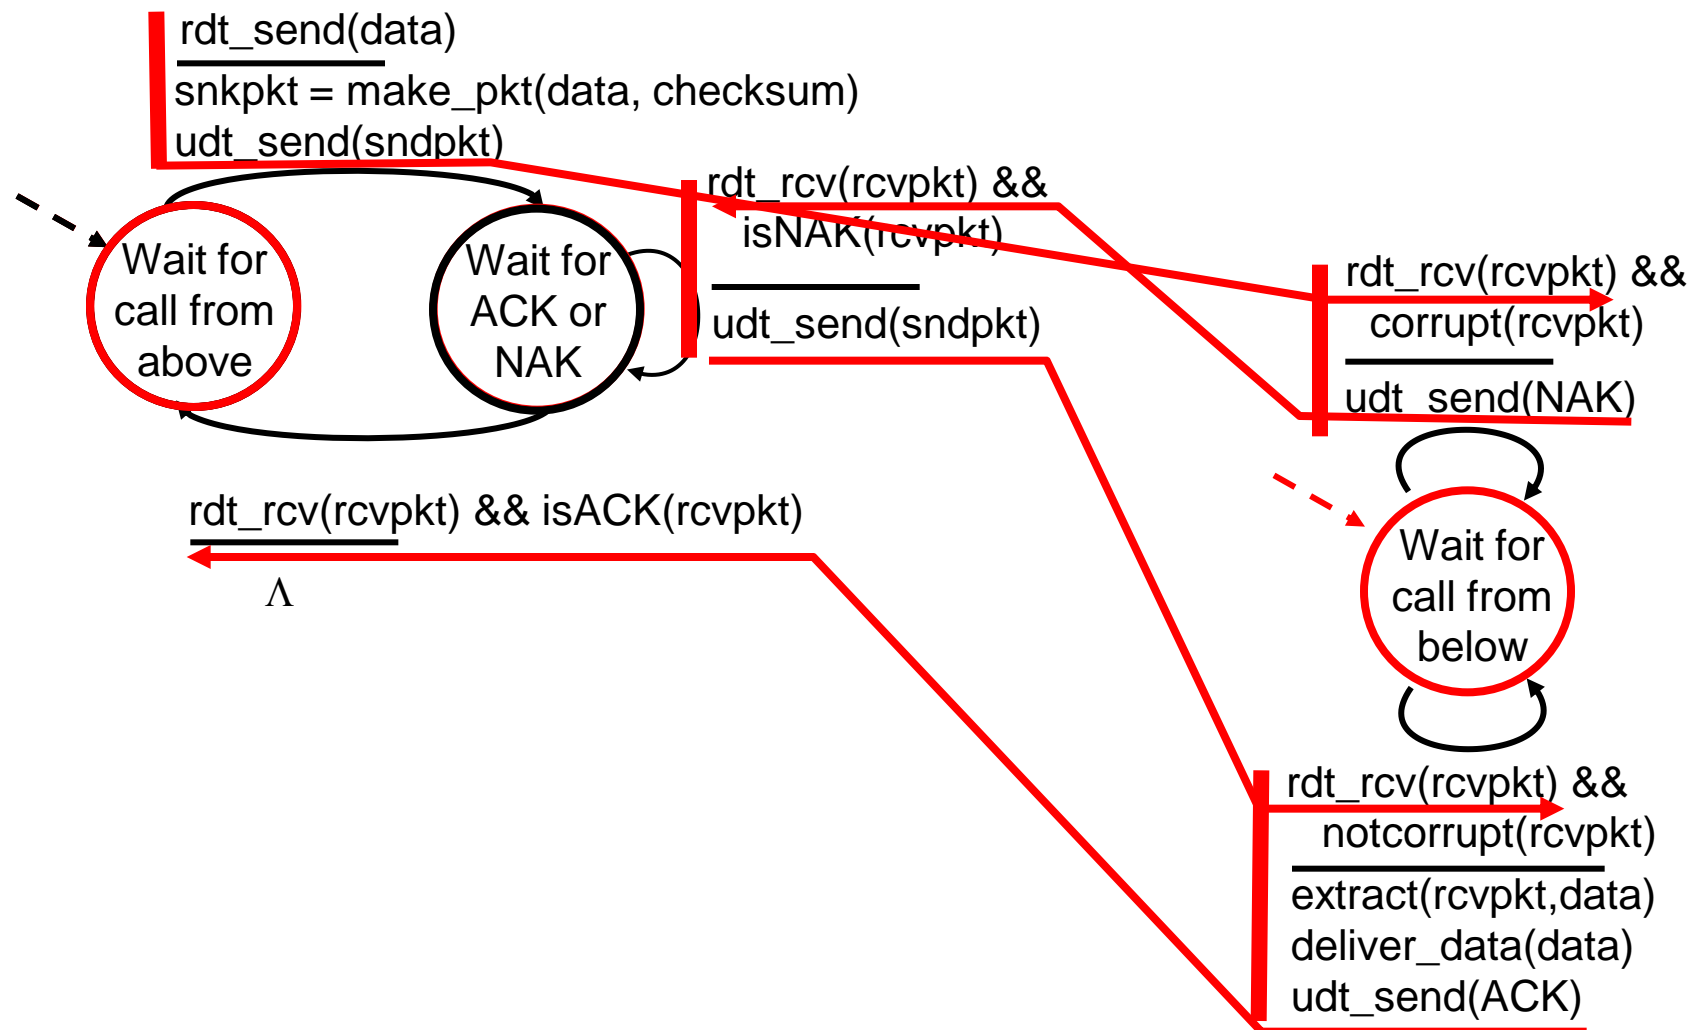

Rdt2.0: FSM Specification

Rdt2.0: Operation with No Error

Rdt2.0: Error Scenario

What happens if ACK/NAK corrupted?

- Sender doesn't know what happened at receiver!
- Can't just retransmit:
possible duplicate

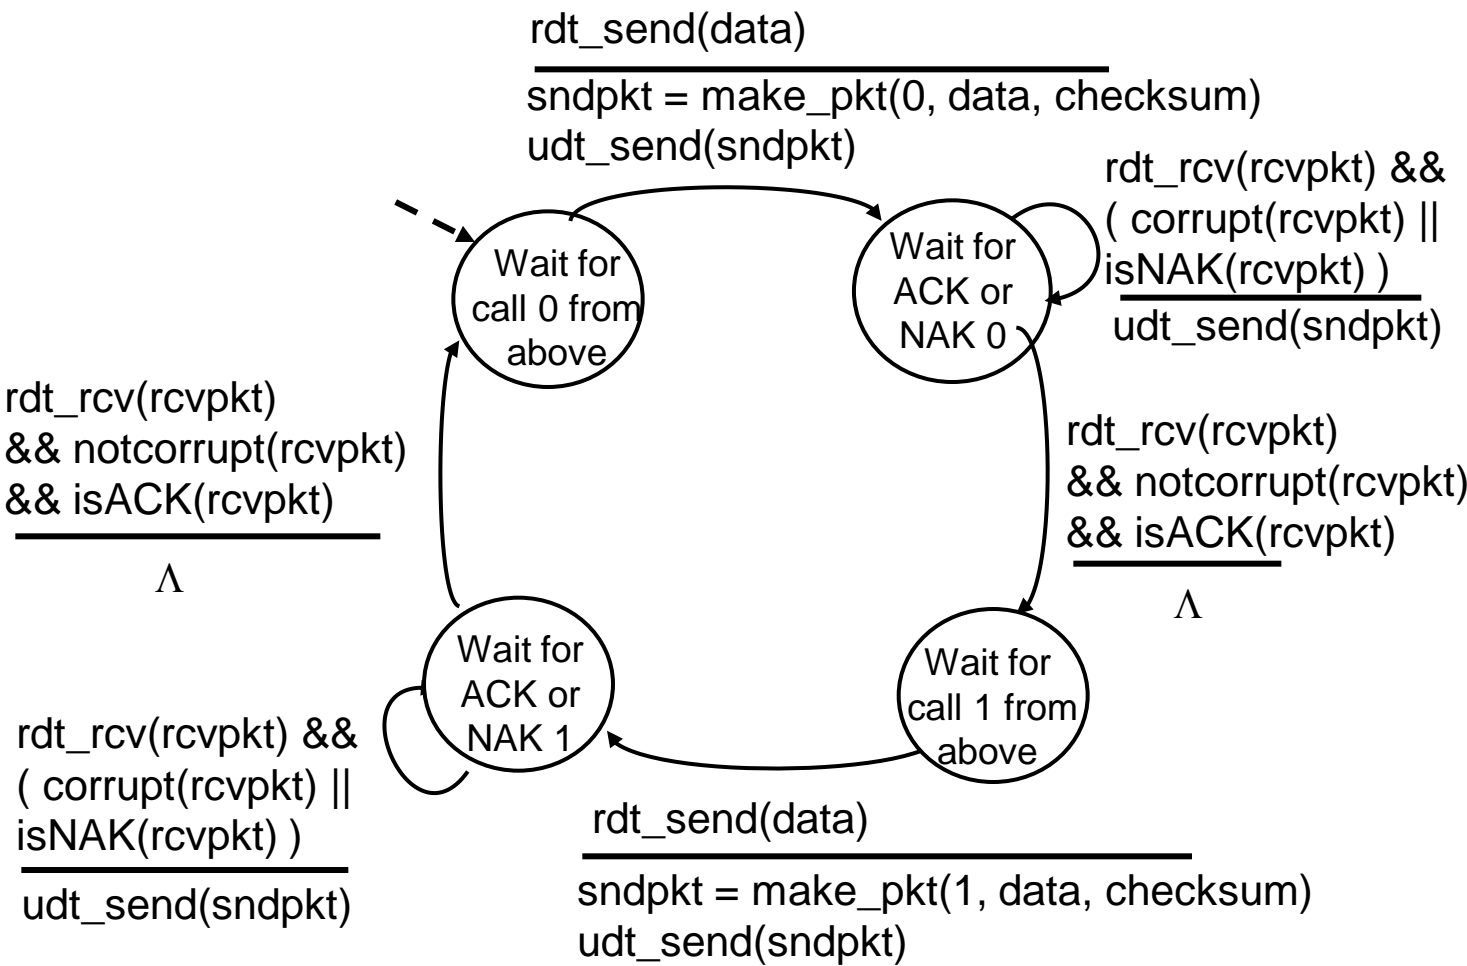

Handling duplicates:

- Sender retransmits current pkt if ACK/NAK garbled
- Sender adds *sequence number* to each pkt
- Receiver discards (doesn't deliver up) duplicate pkt

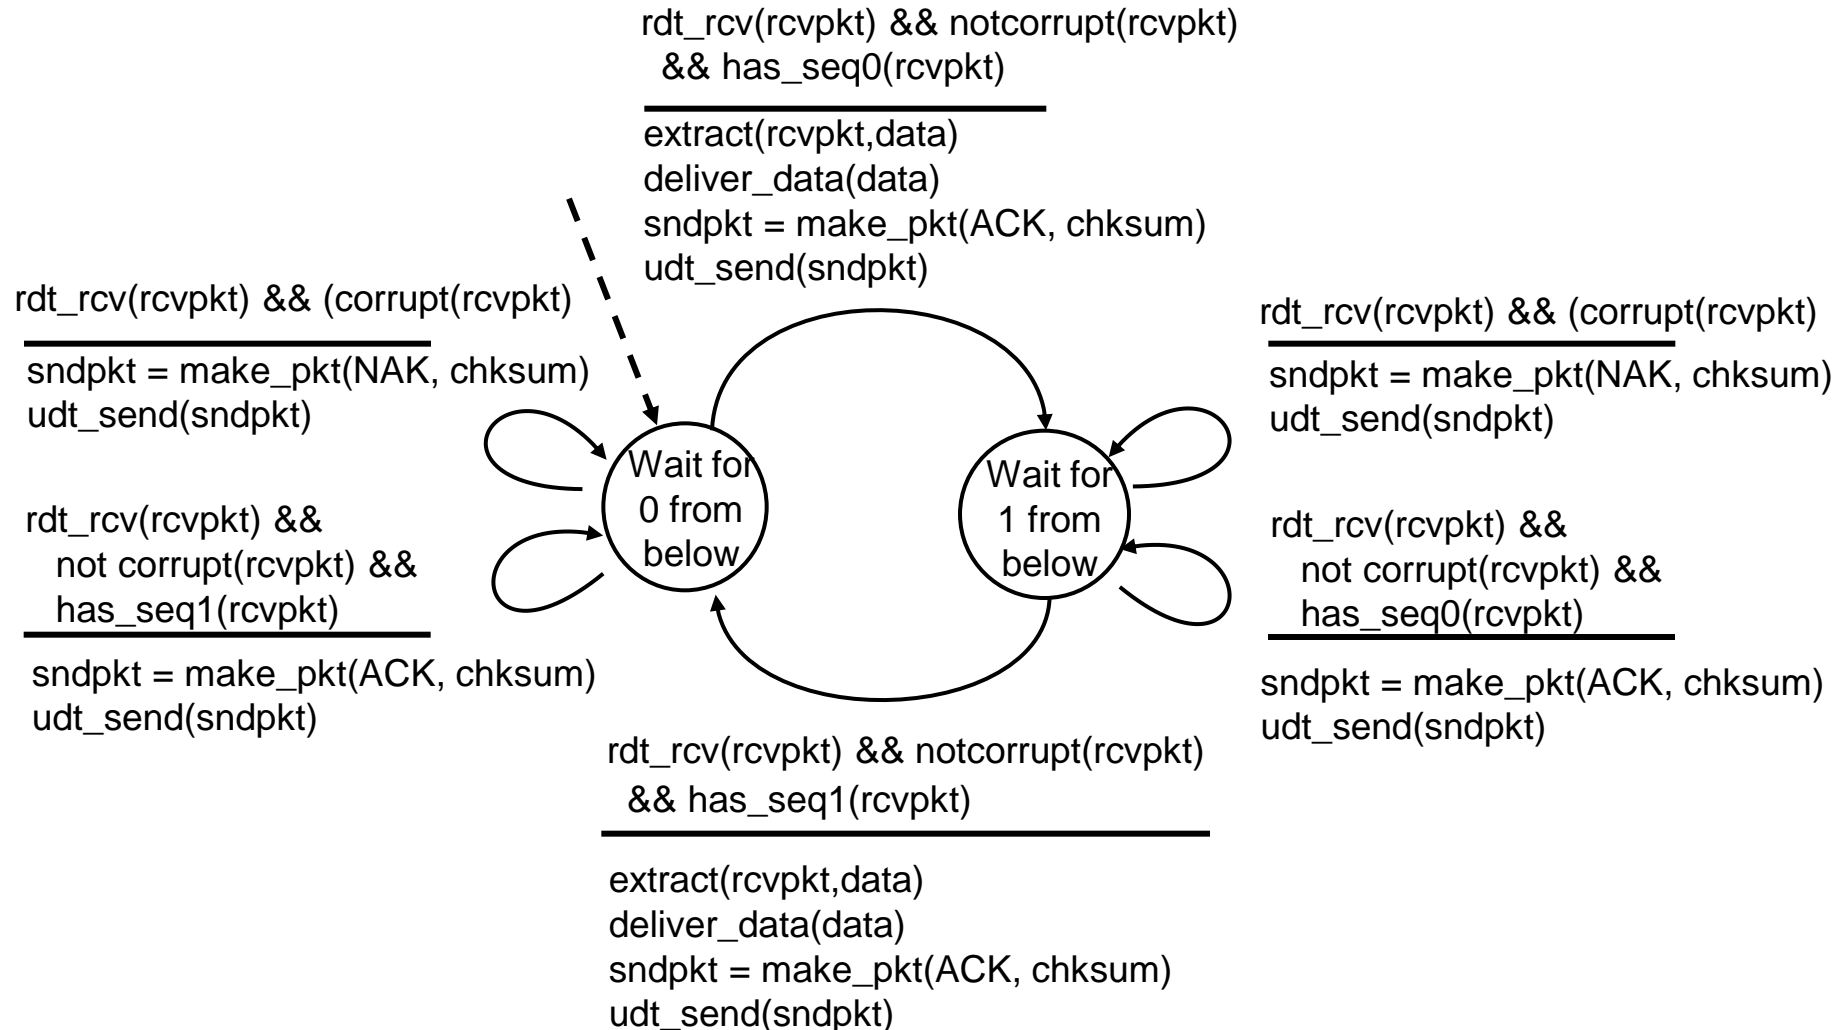

stop and wait

Sender sends one packet,
then waits for receiver
response

Rdt2.1: Sender Handles Garbled ACK/NAKs

Rdt2.1: Receiver Handles Garbled ACK/NAKs

Sender:

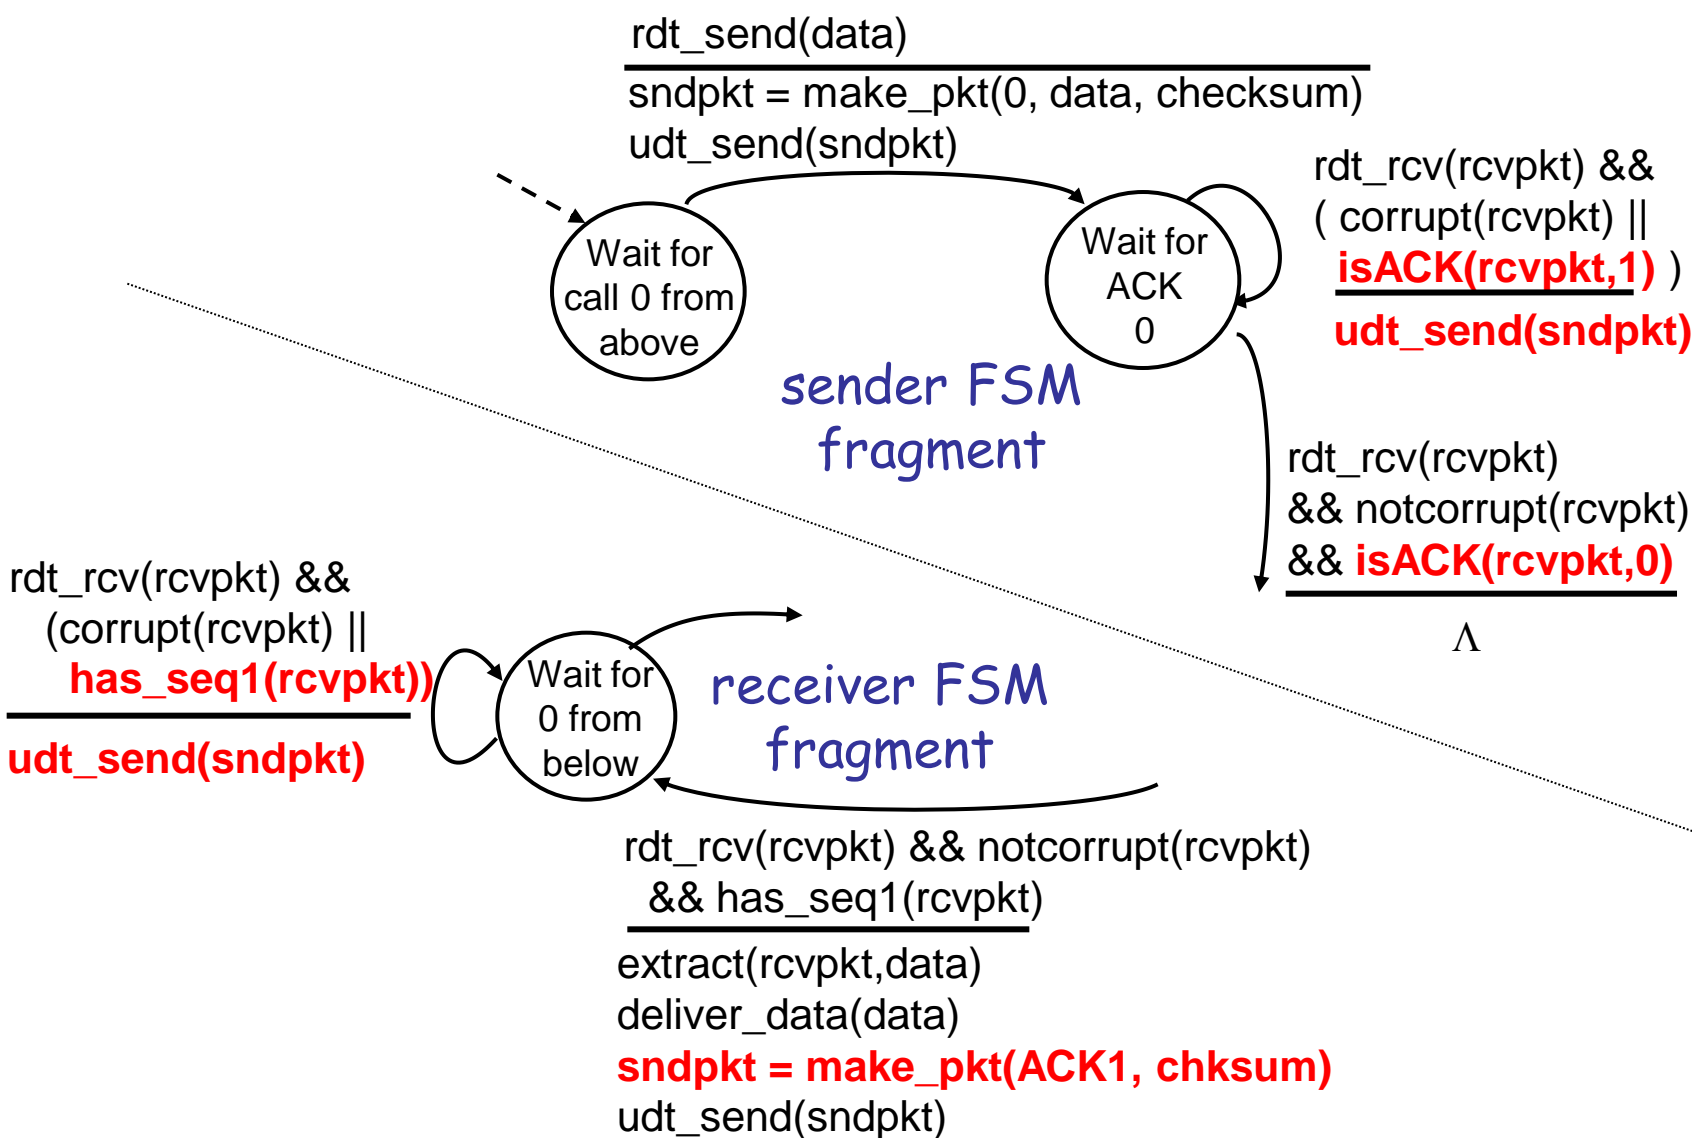

- Seq # added to pkt
- Two seq. #'s (0,1) will suffice. Why?
- Must check if received ACK/NAK corrupted
- Twice as many states
 - » state must “remember” whether “current” pkt has 0 or 1 seq. #

Receiver:

- Must check if received packet is duplicate
 - » State indicates whether 0 or 1 is expected pkt seq #
- Note: receiver can *not* know if its last ACK/NAK received OK at sender

- Same functionality as rdt2.1, using ACKs only
- Instead of NAK, receiver sends ACK for last pkt received OK
 - Receiver must *explicitly* include seq # of pkt being ACKed
- Duplicate ACK at sender results in same action as NAK: *retransmit current pkt*

Rdt2.2: Sender, Receiver Fragments

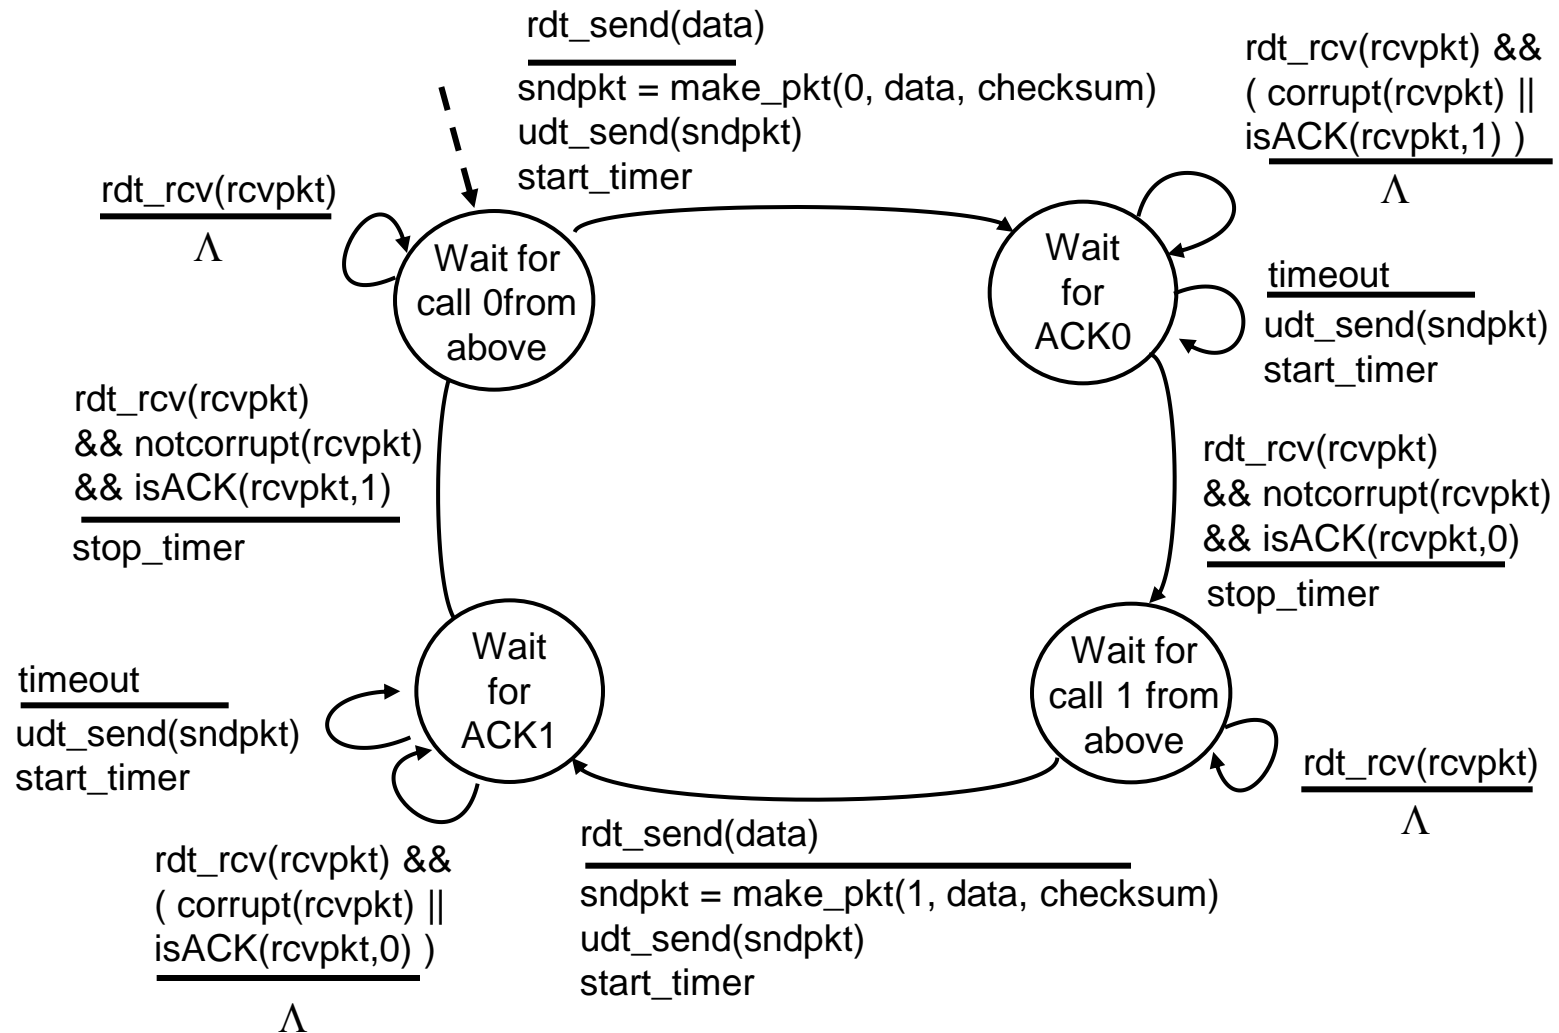

New Assumption:

- Underlying channel can also lose packets (data or ACKs)
 - » checksum, seq. #, ACKs, retransmissions will be of help, but not enough

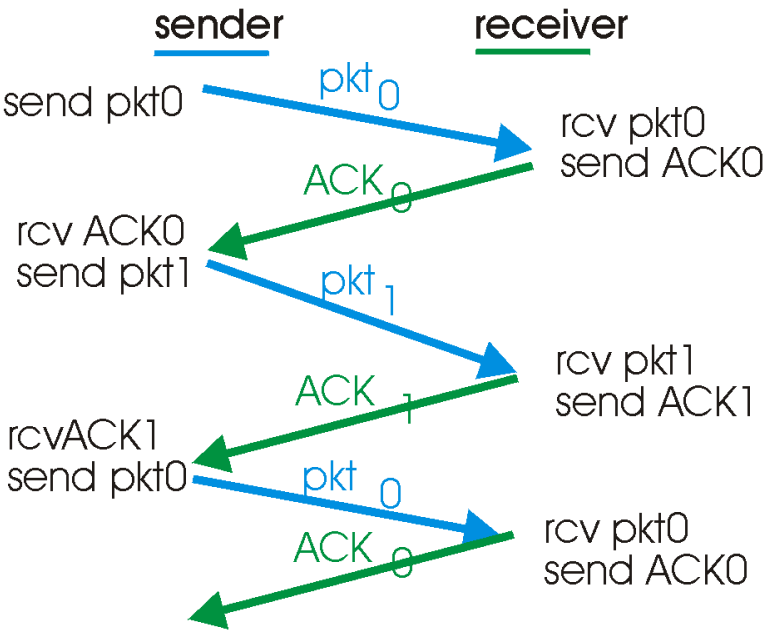

Approach: sender waits “reasonable” amount of time for ACK

- Retransmits if no ACK received in this time
- If pkt (or ACK) just delayed (not lost):
 - » Retransmission will be duplicate, but use of seq. #'s already handles this
 - » Receiver must specify seq # of pkt being ACKed
- Requires countdown timer

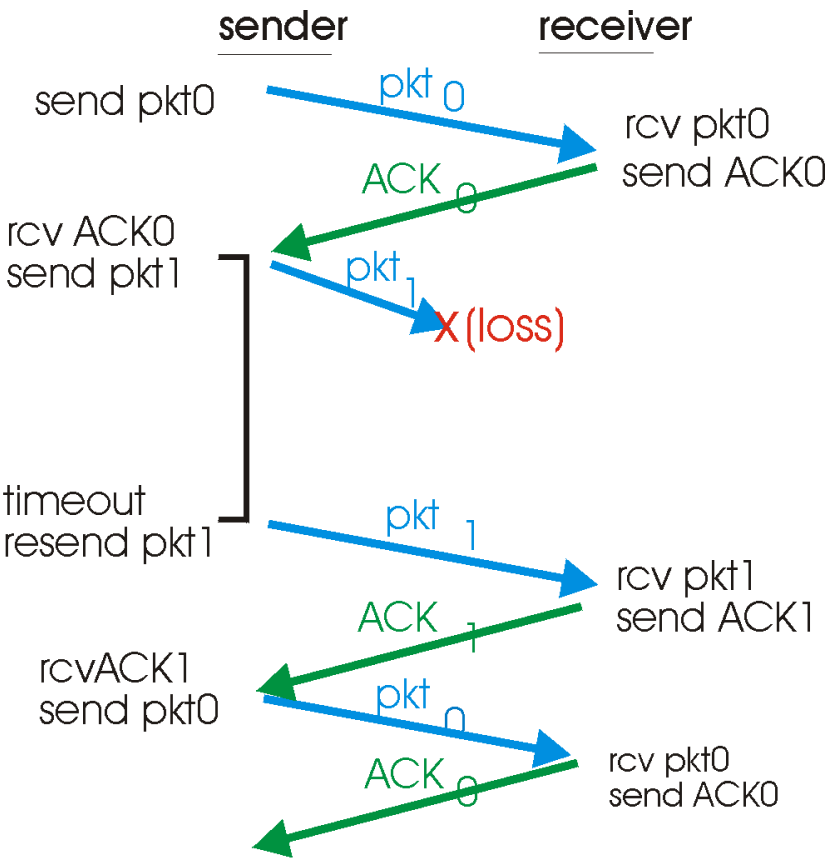

Rdt3.0: Sender

Rdt3.0 in Action

(a) operation with no loss

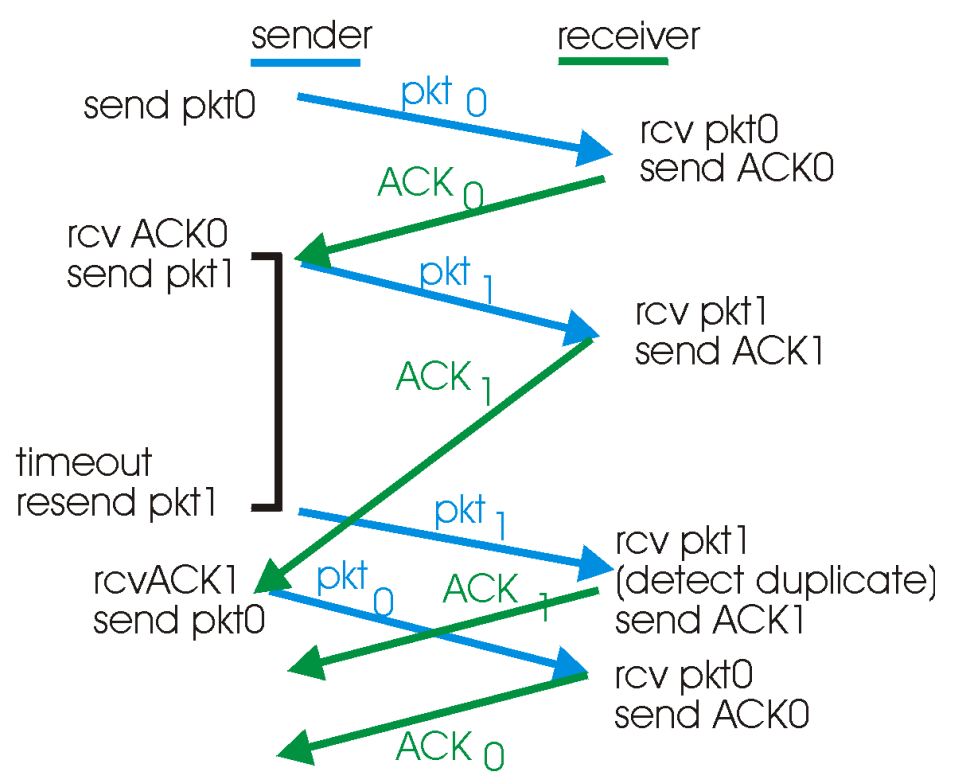

(b) lost packet

Rdt3.0 in Action

(c) lost ACK

(d) premature timeout

- Rdt3.0 works, but performance stinks
- Example: 1 Gbps link, 15 ms e-e prop. delay, 1KB packet:

$$T_{\text{transmit}} = \frac{L \text{ (packet length in bits)}}{R \text{ (transmission rate, bps)}} = \frac{8\text{kb/pkt}}{10^{**9} \text{ b/sec}} = 8 \text{ microsec}$$

- » U_{sender} : **utilization** – fraction of time sender busy sending

$$U_{\text{sender}} = \frac{L / R}{RTT + L / R} = \frac{.008}{30.008} = 0.00027 \text{ microsec}$$

- » 1KB pkt every 30 msec -> 33kB/sec thruput over 1 Gbps link
- » network protocol limits use of physical resources!

Rdt 3.0: Stop-and-Wait Operation

$$U_{\text{sender}} = \frac{L / R}{RTT + L / R} = \frac{.008}{30.008} = 0.00027 \text{ microsec}$$

- Principles of Reliable Data Transfer
- Reliable Data Transfer: Getting Started
- Reliable Data Transfer: Operational Details
- Other Reliable Data Transfer Protocols
- Conclusion

Pipelining: sender allows multiple, “in-flight”, yet-to-be-acknowledged pkts

- Range of sequence numbers must be increased
- Buffering at sender and/or receiver

(a) a stop-and-wait protocol in operation

(b) a pipelined protocol in operation

- Two generic forms of pipelined protocols: *go-Back-N*, *selective repeat*

Pipelining: Increased Utilization

$$U_{\text{sender}} = \frac{3 * L / R}{RTT + L / R} = \frac{.024}{30.008} = 0.0008 \text{ microsecon}$$

Increase utilization
by a factor of 3!

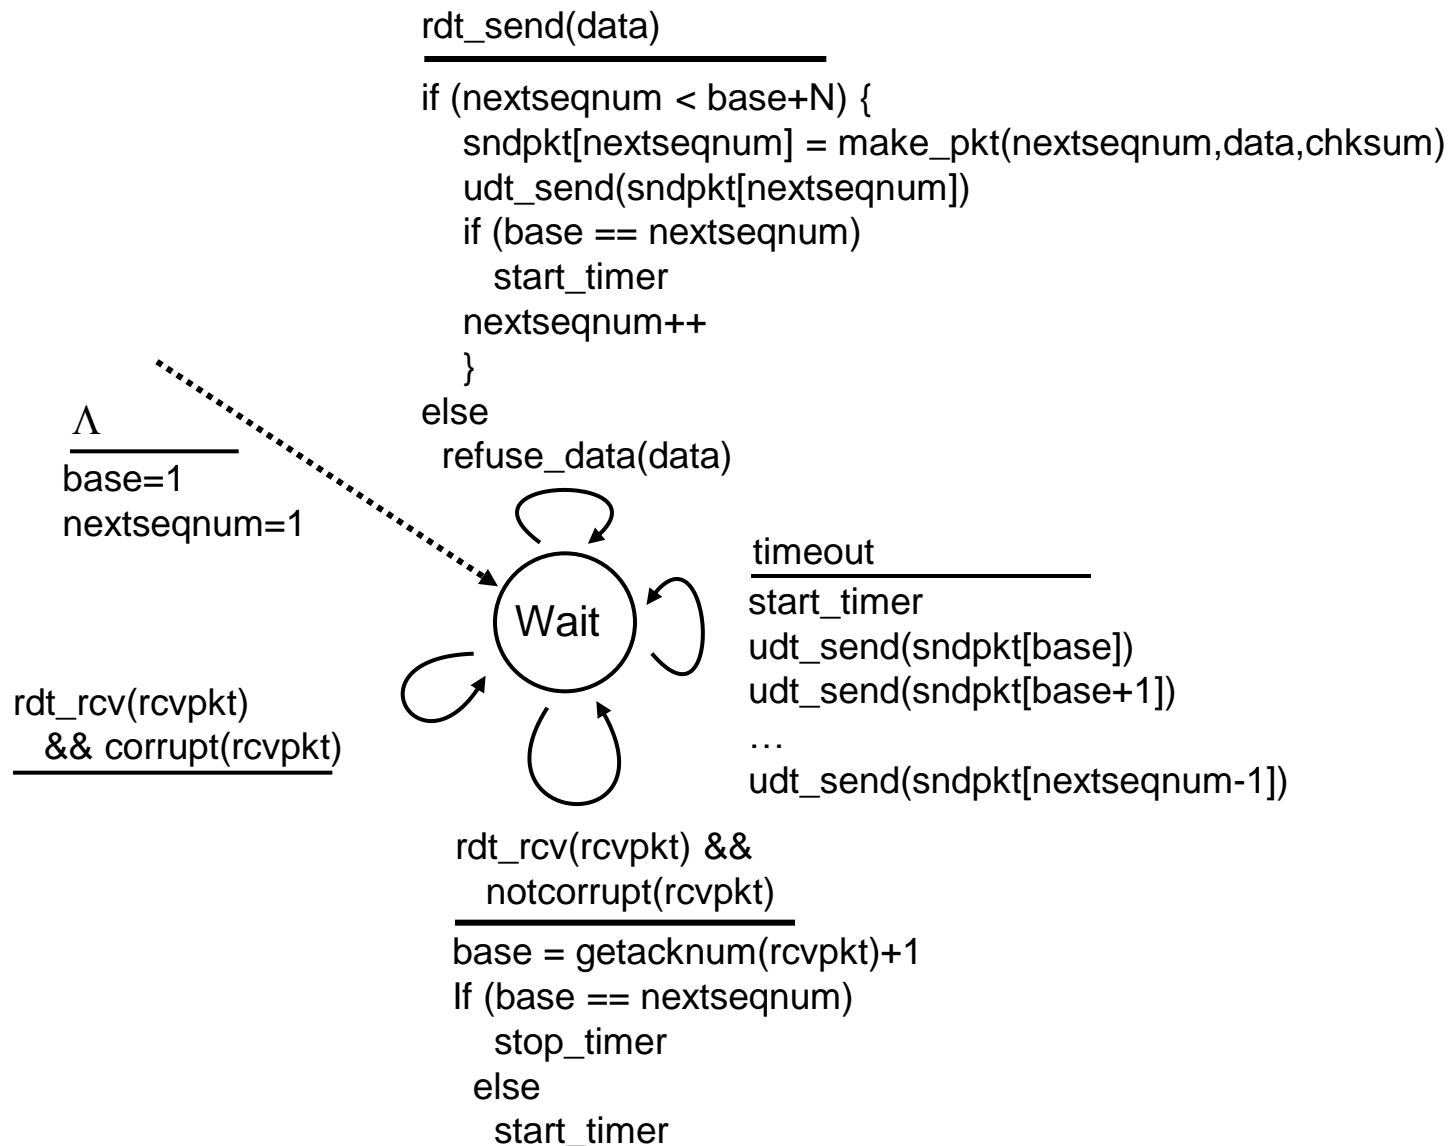

Sender:

- k-bit seq # in pkt header
- “window” of up to N, consecutive unack’ed pkts allowed

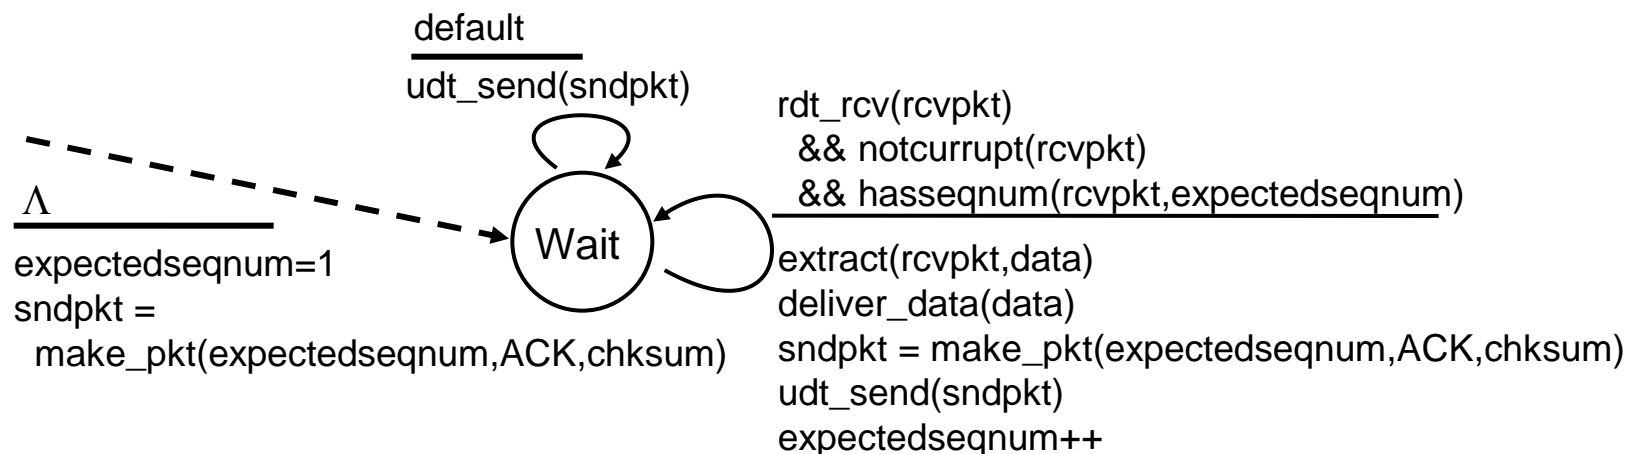

- ACK(n): ACKs all pkts up to, including seq # n - “cumulative ACK”
 - May receive duplicate ACKs (see receiver)
- Timer for each in-flight pkt
- *timeout(n)*: retransmit pkt n and all higher seq # pkts in window

GBN: Sender Extended FSM

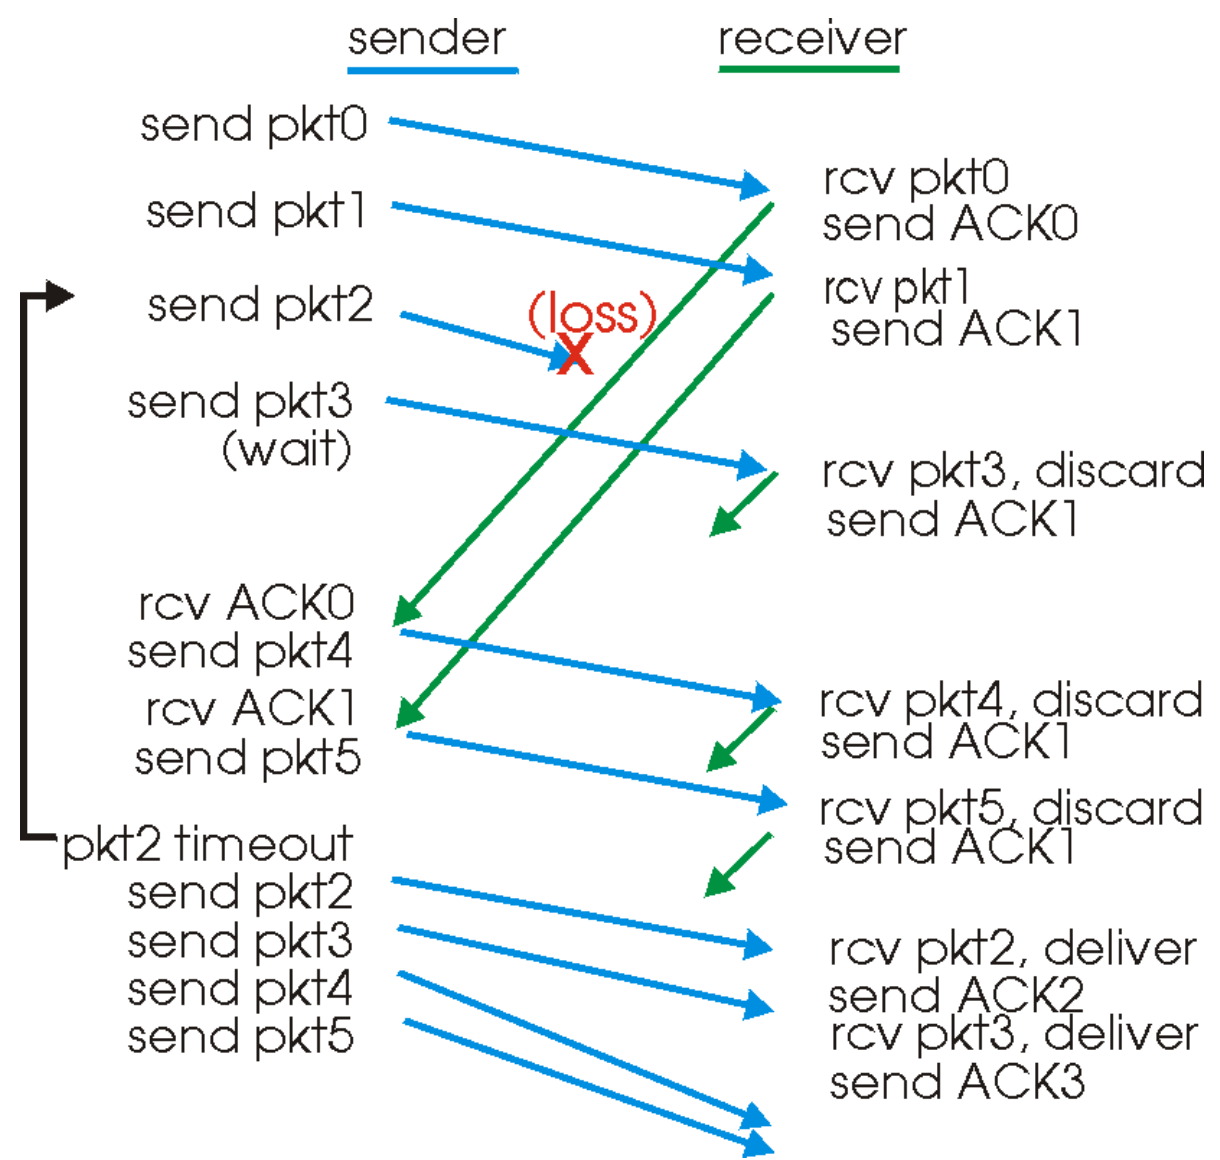

GBN: Receiver Extended FSM

- ACK-only: always send ACK for correctly-received pkt with highest *in-order* seq #
 - May generate duplicate ACKs
 - Need only remember **expectedseqnum**
- Out-of-order pkt:
 - Discard (don't buffer) -> **no receiver buffering!**
 - Re-ACK pkt with highest in-order seq #

GBN In Action

Selective Repeat

- Receiver *individually* acknowledges all correctly received pkts
 - Buffers pkts, as needed, for eventual in-order delivery to upper layer
- Sender only resends pkts for which ACK not received
 - Sender timer for each unACKed pkt
- Sender window
 - N consecutive seq #'s
 - Again limits seq #'s of sent, unACKed pkts

Selective Repeat: Sender, Receiver Windows

(a) sender view of sequence numbers

(b) receiver view of sequence numbers

Selective Repeat

—sender—

Data from above:

- If next available seq # in window, send pkt

Timeout(n):

- Resend pkt n, restart timer

ACK(n) in [sendbase, sendbase+N]:

- Mark pkt n as received
- If n smallest unACKed pkt, advance window base to next unACKed seq #

—receiver—

Pkt n in [rcvbase, rcvbase+N-1]

- Send ACK(n)
- Out-of-order: buffer
- In-order: deliver (also deliver buffered, in-order pkts), advance window to next not-yet-received pkt

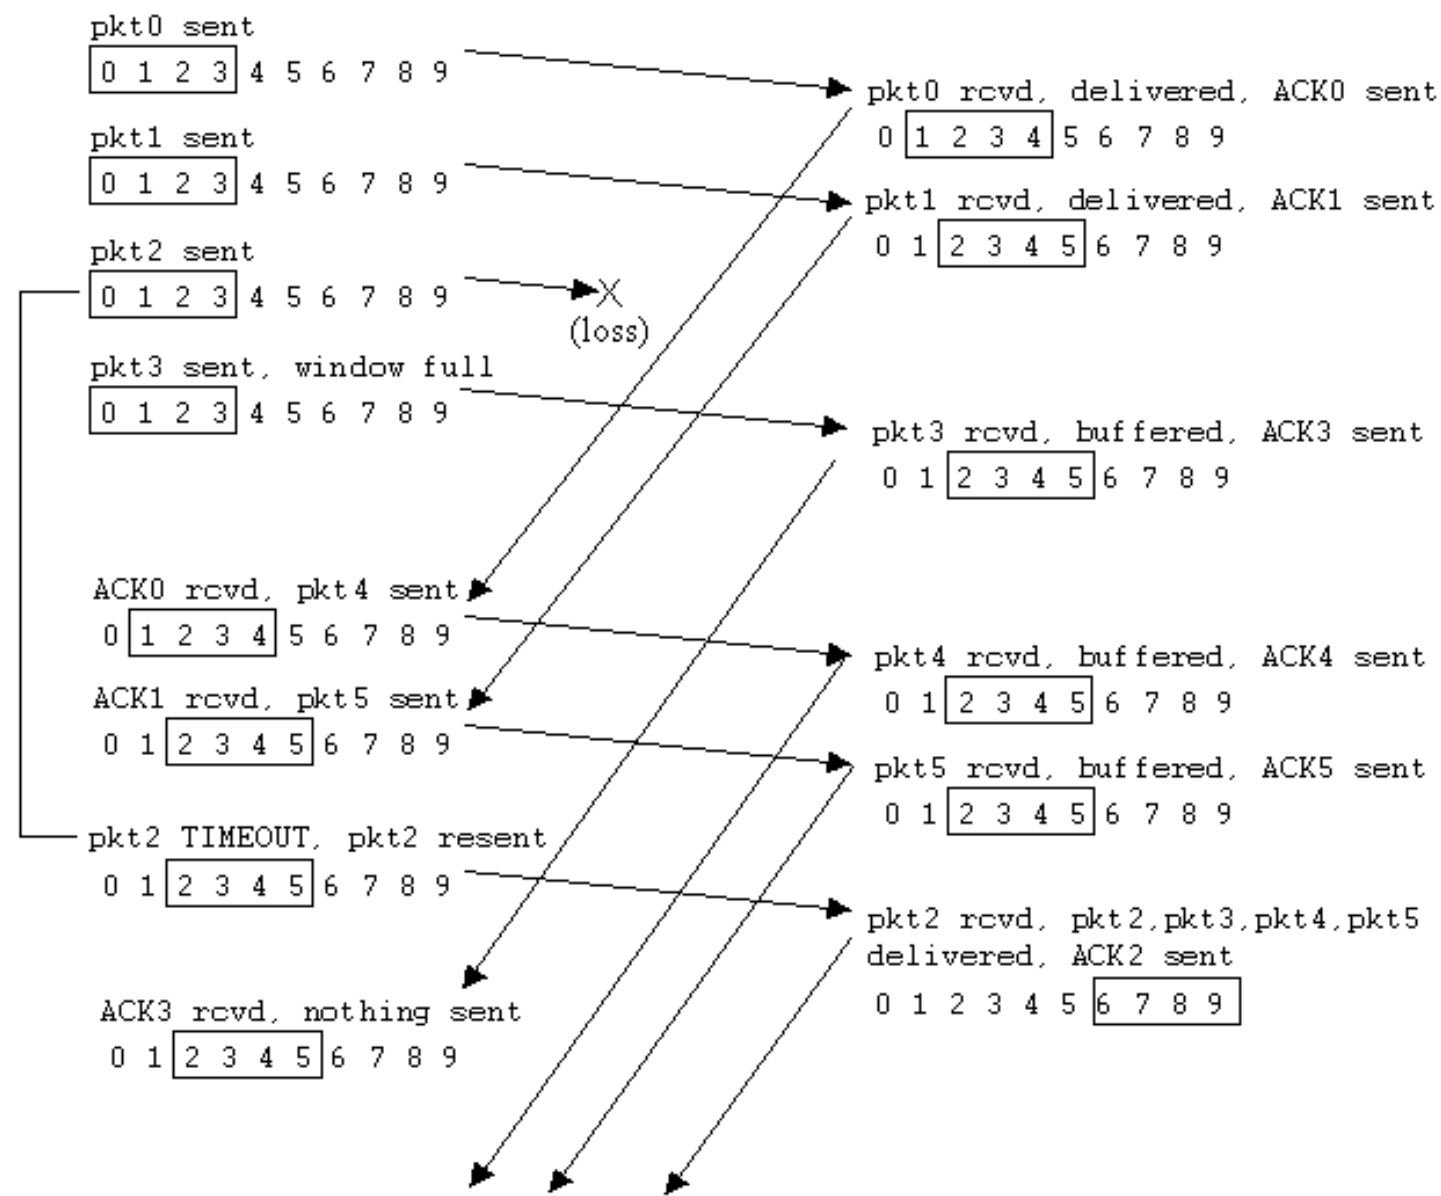

Pkt n in [rcvbase-N, rcvbase-1]

- ACK(n)

Otherwise:

- Ignore

Selective Repeat in Action

Selective Repeat: Dilemma

- Example:
 - Seq #'s: 0, 1, 2, 3
 - Window size=3
 - Receiver sees no difference in two scenarios!
 - Incorrectly passes duplicate data as new in (a)
- Q: what relationship between seq # size and window size?
